Brant Cass

1. https://project6-425519.uc.r.appspot.com
2. Password: Pretzel4
3. For the kinds I used in my data store, enrollments consisted of course_id(int) and student_id(int). I also had courses that had the properties of instructor_id(int), number(int), students(array), subject(string), term(string), and title(string). In the users kind, I had role and sub which were both strings.
4. I also had one bucket to store my photos in which I used about 5 random photos and I accessed as you can see in the code to add and remove the files.
